Office Action Summary

Application No.

10/823,298

Applicant(s)

REN, LIPING

Examiner

Marcos D. Pizarro

Art Unit

2814

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 01 December 2010.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-7,9,11,13,20-23 and 30-35 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-7,9,11,13,20-23 and 30-35 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftperson's Patent Drawing Review (PTO-946)
- 3) ☐ Information Disclosure Statement(s) (PTO/SB/08)
Paper No(s)/Mail Date _____
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date _____
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____

Attorney's Docket Number: IR-2390 (2-3965)
Filing Date: 4/12/2004
Claimed Priority Date: 4/11/2003 (Provisional 60/462,562)
Applicant(s): Ren
Examiner: Marcos D. Pizarro

DETAILED ACTION

This Office action responds to the amendment filed on 12/1/2010.

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after the final rejection mailed on 8/2/2010. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 12/1/2010 has been entered.

Acknowledgment

2. The amendment filed on 12/1/2010, respectively, responding to the Office action mailed on 8/2/2010, has been entered. The present Office action is made with all the suggested amendments being fully considered. Accordingly, pending in this Office action are claims 1-7, 9, 11, 13, 20-23 and 30-35.

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 1-7, 9, 11, 13, and 20-23 are rejected under 35 U.S.C. 103(a) as being unpatentable over Fujishima (US6740952) in view of Tada (US6525390), Rumennik (US6639277), Van Zant, Ghandhi, Noda (US6617652), and Ranjan (US5801431).

5. Regarding claim 1, Fujishima shows (see, *e.g.*, fig. 19) most aspects of the instant invention including a semiconductor device comprising:

- ✓ A semiconductor substrate **1** of a first conductivity type
- ✓ A semiconductor layer of a second conductivity type formed over the substrate **1**
- ✓ A body region **2** of the first conductivity formed in the semiconductor layer
- ✓ An invertible channel in the body region **2**
- ✓ A source region **3** of the second conductivity type formed in the body region **2** and adjacent to the channel
- ✓ A gate structure formed over the channel region including:
 - a gate electrode **9**
 - a gate insulation layer **7** spacing the gate electrode **9** from the channel
- ✓ A drain region **6** formed in the semiconductor layer
- ✓ A drift region **5** in the semiconductor layer spacing the body region **2** from the drain region **6**

- ✓ A field plate structure disposed over the drift region **5** including:
 - a first insulation layer **8** of a first thickness extending from the gate insulation layer
 - a second insulation layer **10** of a second thickness formed over the first insulation layer **8**
 - a third insulation layer **25** of a third thickness
 - a first plate **9** disposed over the first insulation layer **8**
 - a second plate **FP1** disposed over the second insulation layer **8**
 - a third plate **FP2/FP3** spaced from the second plate **FP1** by the third insulation layer **25**

Wherein:

- ✓ the first plate **9** includes a first portion extending from the gate electrode (see, *e.g.*, fig. 19)
- ✓ the second plate **FP1** includes (see, *e.g.*, fig. 19):
 - a first portion
 - a second portion
 - a second gap separating the portions
- ✓ the third plate includes (see, *e.g.*, fig. 19):
 - a first portion **FP2**
 - a second portion **FP3**
 - a third gap **Wg** separating the portions
- ✓ the second gap is wider than the third gap **Wg** (see, *e.g.*, fig. 19)

- ✓ the device exhibits a breakdown voltage of at least 600 volts (see, *e.g.*, col.35/III.1-3)

6. Fujishima, however, fails to show a resurf region of the first conductivity type in the semiconductor layer, wherein the resurf region is formed over at least a portion of the drift region between the body region and the drain region, and wherein the resurf region is adjacent to and in contact with the drain region. Tada, on the other hand, shows a resurf region **44** of the first conductivity type in a semiconductor layer, wherein the resurf region is formed over at least portion of a drift region **3** between a body region **2** and a drain region **6**, and wherein the resurf region is adjacent to and in contact with the drain region (see, *e.g.*, fig. 10). He further teaches that said resurf region would secure certain breakdown voltage while at the same time reducing the on-resistance of Fujishima's device (see, *e.g.*, Tada: col.12/II.17-37).

7. It would have been obvious at the time of the invention to one of ordinary skill in the art to have the resurf region of Tada in the semiconductor layer of Fujishima to secure a certain breakdown voltage while at the same time reducing the on-resistance of the device.

8. Fujishima, however, fails to show the first plate including a second portion spaced from the first portion of the first plate by a first gap wider than the second gap, wherein said second portion is electrically connected to the drain region. Rumennik (see, *e.g.*, figs. 1 and 2), on the other hand, shows a first plate similar to Fujishima including a first portion **12** spaced from a second portion **26** by a gap wider than the gap separating first and second portions **10,11** of a second plate above the first plate. The

second portion **26** is electrically connected to the drain region **19** and would increase the breakdown voltage of Fujishima (see, *e.g.*, Rumennik: figs. 1 and 2, and col.4/II.42-45).

9. It would have been obvious at the time of the invention to one of ordinary skill in the art to include the second portion suggested by Rumennik in the first plate of Fujishima to reduce the field concentration at the boundary between the drain region and the drift region.

10. Fujishima also fails to show the semiconductor layer being epitaxially formed and extending below the body region. Rumennik, on the other hand, shows the semiconductor layer being epitaxially formed (see, *e.g.*, col.7/II.21) and extending below the body region (see, *e.g.*, fig.5 and fig.6). Van Zant (see, *e.g.*, pp.382), on the other hand, teaches that epitaxially forming Fujishima's semiconductor layer would allow accurate control of the doping concentrations of the layer. Ghandhi (see, *e.g.*, pp.258) teaches that epitaxially forming Fujishima's semiconductor layer on the substrate would eliminate the problems of compatibility or mismatch between the layer and the substrate.

11. It would have been obvious at the time of the invention to one of ordinary skill in the art to epitaxially form Fujishima's semiconductor layer, as suggested by Rumennik, Van Zant, and Ghandhi, to eliminate compatibility problems between the layer and the substrate and to accurately control the doping concentrations of the layer.

12. Fujishima fails to show the first and second portions of the second field plate, and the first and second portions of the third field plate being disposed around the drain

region. Noda, on the other hand, teaches (see, *e.g.*, fig. 1) that annular circular plates formed concentrically around the drain diffusion region of Fujishima would improve the breakdown properties of the device (see, *e.g.*, Noda/col.14/ll.20-22 and col.9/ll.38). Ranjan elaborates by teaching that the series of plates in Noda reduce the tendency to concentrate high electric fields near the surface of the device thereby improving its breakdown voltage (see, *e.g.*, Ranjan/col.5/ll.52-56).

13. It would have been obvious at the time of the invention to one of ordinary skill in the art to form the first and second portions of the second and third plates of Fujishima/Rumennik as annular portions disposed around the drain region, as suggested by Noda and Ranjan, to further improve the breakdown voltage properties of the device.

14. Regarding claims 2, 4, and 6, Fujishima shows the first **8**, second **10** and third **25** insulation layers comprising an oxide (see, *e.g.*, fig. 19)

15. Regarding claim 3, Fujishima shows the first thickness is 0.6 microns (see, *e.g.*, col.36/ll.20) but fails to specify the claimed thickness of 0.4 microns. However, differences in thickness will not support the patentability of subject matter encompassed by the prior art unless there is evidence indicating such thickness is critical. "Where the general conditions of a claim are disclosed in the prior art, it is not inventive to discover the workable ranges by routine experimentation". *In re Aller*, 220 F.2d 454,456,105 USPQ 233, 235 (CCPA 1955).

16. Fujishima also teaches that the first thickness, as well as the other thicknesses of the different insulation layers, affects the performance and the area of the device (see,

e.g., col.37/ll.15-29, col.8/ll.36-40, and col.39/ll.17-31). Therefore, it is necessary to ensure that the insulation layers are of an appropriate thickness (see, *e.g.*, Fujishima/col.35/ll.60-62). The specific claimed first thickness, *i.e.*, 0.4 microns, absent any criticality, is only considered to be the "optimum" thickness disclosed by Fujishima that a person having ordinary skill in the art would have been able to determine using routine experimentation based, among other things, on the desired device performance, manufacturing costs, etc. (see Boesch, 205 USPQ 215 (CCPA 1980)), and since neither non-obvious nor unexpected results, *i.e.*, results which are different in kind and not in degree from the results of the prior art, will be obtained as long as the first thickness provides for a stable performance of the device, as already suggested by Fujishima.

17. Since the applicant has not established the criticality (see next paragraph below) of the claimed thickness of 0.4 microns, it would have been obvious to one of ordinary skill in the art to use these values in the device of Fujishima.

CRITICALITY

18. The specification contains no disclosure of either the critical nature of the claimed thickness or any unexpected results arising therefrom. Where patentability is said to be based upon particular chosen dimensions or upon another variable recited in a claim, the applicant must show that the chosen dimensions are critical. *In re Woodruff*, 919 F.2d 1575, 1578, 16 USPQ2d 1934, 1936 (Fed. Cir. 1990).

19. Regarding claim 5, Fujishima shows the second thickness is 1.3 microns (see, *e.g.*, col.39/ll.5).

20. Regarding claim 7, Fujishima shows the third thickness is 2.5 microns (see, *e.g.*, col.39/ll.7) instead of the claimed thickness of 1.4 microns. See also the comments stated above in paragraphs 15-18 with respect to the differences between the claimed thickness and that of the prior art, which are considered repeated here.

21. Regarding claim 9, Fujishima shows the first field plate **9** comprising gate electrode material (see, *e.g.*, col.39/ll.9-10). Van Zant (see, *e.g.*, pp. 511), on the other hand, teaches that doped polysilicon is the standard gate electrode material for Fujishima's device.

22. Regarding claim 11, Fujishima shows that the gap between the portions of the second field plate **FP1** is 45 microns (see, *e.g.*, col.37/ll.29-34 and col.39/ll.13-16).

23. Regarding claim 13, Fujishima shows the third field plate **FP2** comprising a first portion and a second portion (see, *e.g.*, fig. 19), wherein a gap of 25 microns separates the portions (see, *e.g.*, col.37/ll.32).

24. Regarding claim 20, Fujishima shows the first portion of the first plate **9** terminating below the first portion of the second plate **FP1** (see, *e.g.*, fig. 19).

25. Regarding claim 21, Fujishima shows the second portion of the second field plate **FP1** is electrically connected to the drain region **6** and to the second portion of the third plate **FP2** (see, *e.g.*, fig. 19).

26. Regarding claim 22, Fujishima shows the first portion of the second plate **FP1** is electrically connected to the first portion of first plate **9** (see, *e.g.*, fig. 19).

27. Regarding claim 23, Fujishima shows the first portion of the third plate **FP2** is electrically connected to the source region **3** (see, *e.g.*, fig. 19).

28. Claims 30-35 are rejected under 35 U.S.C. 103(a) as being unpatentable over Nakagawa (US4766474) in view of Imam (US6492679).

29. Regarding claim 30, Nakagawa shows (see, *e.g.*, fig. 2(f)) most aspects of the instant invention including a field plate structure for a laterally diffused high voltage semiconductor device, the structure comprising:

- ✓ A first field plate having:
 - A first portion **10**
 - A second portion **14**
 - A first gap separating the portions
- ✓ A second field plate having:
 - A first portion **8**
 - A second portion **9**
 - A second gap separating the portions

Wherein:

- ✓ The first field plate is disposed over a first insulation layer **11**
- ✓ The second field plate is disposed over the first field plate by a second insulation field **12**
- ✓ The second gap is narrower than the first gap

30. Nakagawa also teaches that the first portion of the second plate is electrically connected to the first portion of the first plate (see, *e.g.*, fig. 2(f) and col.1/ll.43-45). He, however, fails to show a reduced surface field drift region of the device. In a similar device to Nakagawa, Imam teaches that said region would allow for a high breakdown voltage and a low on-resistance. See, *e.g.*, Imam: col.3/ll.19-25.

31. It would have been obvious at the time of the invention to one of ordinary skill in the art to include the reduced surface field drift region of Imam in the device of Nakagawa to achieve a high breakdown voltage and a low on-resistance.

32. Regarding claim 31, Nakagawa shows the first portion **10** of the first field plate is electrically connected to a gate electrode of the device (see, *e.g.*, fig. 2(f)).
33. Regarding claim 32, Nakagawa shows the second portion **9** of the second field plate is electrically connected to a drain region **3** of the device (see, *e.g.*, fig. 2(f)).
34. Regarding claim 33, Nakagawa shows the second portion **14** of the first field plate is electrically connected to the second portion **9** of the second field plate (see, *e.g.*, fig. 2(f)).
35. Regarding claim 34, Nakagawa shows the structure further comprising a third field plate having a first portion **8'** and a second portion **9'** separated by a third gap, wherein the third plate is disposed over the second plate by a third insulation layer **15**, and wherein the third gap is narrower than the second gap (see, *e.g.*, fig. 2(f)).
36. Regarding claim 35, the first portion **8'** of the third plate is electrically connected to a source region **2** of the device (see, *e.g.*, fig. 2(f)).

Response to Arguments

37. The applicant argues:
38. The combination of Fujishima and Tada does not result in the present invention as described in claim 1. Tada includes spiral polysilicon thin film **10** arranged on field oxide **8** (see, *e.g.*, fig. 10 and col.10/ll.16-18). Thus, the combination of Fujishima and Tada cannot disclose and rather teaches away from, for example, first, second, and third gaps, where the gaps are filled only with an insulation material.
39. The examiner responds:
40. The test for obviousness is not whether the features of a secondary reference may be bodily incorporated into the structure of the primary reference; nor is it that the claimed invention must be expressly suggested in any one or all of the references. Rather, the test is what the combined teachings of the references would have

suggested to those of ordinary skill in the art. See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981).

41. Specifically in regards to the spiral thin film **10** of Tada, this particular feature need not be bodily incorporated in Fujishima. As taught by Tada, the spiral thin film **10** shields the device against charges in the plastic mold of the device. Because of this film **10**, deviations in the breakdown voltage are hardly caused even when a high voltage is applied (see, *e.g.*, Tada: col.10/ll.40-50). Fujishima, on the other hand, teaches that even in the presence of said charge accumulation mentioned by Tada at the interface of the mold resin, a stable breakdown voltage is obtained because of his device structure (see, *e.g.*, Fujishima: col.37/ll.14-28).

42. In any event, none of the above arguments presented by the applicant negates the benefits of the resurf region **44** of Tada and its application to Fujishima. That is, that the resurf region **44** of Tada would secure certain breakdown voltage while at the same time reducing the on-resistance of Fujishima's device (see, *e.g.*, Tada: col.12/ll.17-37).

43. The applicant argues:

44. Amended claim 30 now recites that that first portion of the second field plate is electrically connected to the first portion of the first field plate, which is not taught or disclosed by Nakagawa or Imam.

45. The examiner responds:

46. The prior art of record clearly shows these features of the claimed invention. See, *e.g.*, col.1/ll.43-45, where Nakagawa teaches that the first portion of the second field plate is electrically connected to the first portion of the first field plate.

Conclusion

47. Papers related to this application may be submitted directly to Art Unit 2814 by facsimile transmission. Papers should be faxed to Art Unit 2814 via the Art Unit 2814 Fax Center. The faxing of such papers must conform to the notice published in the Official Gazette, 1096 OG 30 (15 November 1989). The Art Unit 2814 Fax Center number is **(571) 273-8300**. The Art Unit 2814 Fax Center is to be used only for papers related to Art Unit 2814 applications.

48. Any inquiry concerning this communication or earlier communications from the examiner should be directed to **Marcos D. Pizarro** at **(571) 272-1716** and between the hours of 10:00 AM to 8:30 PM (Eastern Standard Time) Monday through Thursday or by e-mail via Marcos.Pizarro@uspto.gov. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Wael Fahmy, can be reached on (571) 272-1705.

49. Any inquiry of a general nature or relating to the status of this application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the

Art Unit: 2814

automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
